# Chiral Bifunctional Thiosquaramides as Organocatalysts in the Synthesis of Enantioenriched 3,3-Disubstituted Oxindoles 

Patricia Rodríguez-Ferrer, ${ }^{[a]}$ Daniel Naharro, ${ }^{[a]}$ Alicia Maestro, ${ }^{[a]}$ José M. Andrés, ${ }^{*[a]}$ and Rafael Pedrosa.*[a]

#### Abstract

Four novel chiral bifunctional thiosquaramides have been prepared from cyclopentyl dithiosquarates and diamines derived from natural L-Valine and L-tert-Leucine. The novel thiosquaramides have been tested as organocatalyst in the nitro-Michael addition of 3 -substituted oxindoles to different $\beta$-aryl substituted nitroalkenes. The reaction occurred easily in high yields and excellent stereoselectivities, showing that the novel organocatalysts are much more effective that their thioureas and squaramides homologs.

## Introduction

Since the explosion of organocatalysis twenty years ago, a lot of small metal-free molecules able to promote stereoselective transformations have been developed. Among them, bifunctional organocatalysts that activate both the nucleophile by a basic appendage, and the electrophile by H -bond formation behave as very efficient catalysts. The catalytic activity of these structures is dependent on the strength of the formed hydrogen bond, and the stereoselectivity on the nature of the chiral appendage. Searching for the modification of the acidity of the catalysts, chiral ureas, ${ }^{[1]}$ thioureas, ${ }^{[2]}$ and squaramides, ${ }^{[3]}$ have been the most common organocatalysts used in different stereoselective transformations.
Thiosquaramides are known more than fifty years ago, ${ }^{[4]}$ and they have more acidic character than squaramides. They are more soluble than squaramides in non-polar solvents as a consequence of less self-aggregation, and they have been calculated to be better organocatalysts than thioureas or squaramides. ${ }^{[5]}$ They have been used as anion transporters, ${ }^{[6]}$ or in the formation of complex of transition metal derivatives, ${ }^{[7]}$ but only very recently it has described a general synthesis of these substrates and used as organocatalysts. ${ }^{[8]}$ Our interest in developing bifunctional organocatalysts ${ }^{[9]}$ lead us to consider the preparation of novel bifunctional thiosquaramides and study if
they were able to promote enantioselective additions of 3substituted oxindoles to nitrostyrenes.

The selection of oxindole derivatives as nucleophiles was motivated by the interest of the addition products as biological active substrates, ${ }^{[10]}$ and nitrostyrene because it is the most employed electrophile used in organocatalyzed conjugate additions, and the possibilities of transformations of the nitro functionality in the final products. The synthesis of enantioenriched 3,3-disubstituted oxindoles has received a lot of attention, ${ }^{[11]}$ but the most studied organocatalyzed transformation refers to the Michael addition of 3-substituted oxindoles to nitroolefins catalyzed by bifunctional thioureas. In that way, bifunctional thioureas bearing as chiral appendage cinchona alkaloids, ${ }^{[12]}$ 1,2-cyclohexanediamine, ${ }^{[13]}$ and 1,2diphenyl ethylenediamine ${ }^{[14]}$ have been used with high effectiveness.

Organocatalyst such as guanidines,, ${ }^{[15]}$ phosphoramides, ${ }^{[16]}$ aminoindanol, ${ }^{[17]}$ phase transfer catalysts, ${ }^{[18]}$ chiral secondary amines, ${ }^{[19]}$ or bifunctional squaramides derived from 1,2cyclohexane diamine, ${ }^{[20]}$ and quinine ${ }^{[21]}$ have been also used to promote the same stereoselective addition. Chiral bifunctional thioureas have been also employed in enantioselective additions of 3 -substituted oxindoles to maleimides, ${ }^{[22]}$ and unsaturated ketones or sulfones. ${ }^{[23]}$

Now we report on the synthesis of novel bifunctional chiral thiosquaramides with diamines derived from (L)-valine and (L)-tert-leucine (Th-sq-la,b and Th-sq-Ila,b, Figure 1), and their unprecedented application as organocatalysts in the stereoselective synthesis of 3,3-disubstituted oxindoles with two quaternary-tertiary stereocenters. Known thioureas (Th-la,b) ${ }^{[24]}$ and squaramides (sq-la,b) ${ }^{[25]}$ have also tested in the same reaction for comparative purposes.

## Results and Discussion

The synthesis of thiosquaramides was carried out in two steps from cyclopentyl dithiosquarate $\mathbf{1}^{[8 a]}$ as summarized in Scheme 1. The reaction of dithiosquarate with 0.9 equivalents of benzylamine or 3,5-bis(trifluoromethyl)benzylamine, in dichloromethane (DCM) at room temperature, lead to the monodisplacement derivatives $2^{[8 \mathrm{a}]}$ and 3, respectively, in good yields. These hemidithiosquarates were transformed into the final chiral bifunctional thiosquaramides (Th-sq-la,b, and Th-sqlla,b) in moderate to good yields by reaction with 1.1 equivalents of diamines ${ }^{[26]}$ derived from natural L-Valine and L-tert-Leucine in DCM at room temperature. It is interesting to note that, contrary to the very well-known synthesis of unsymmetrically substituted squaramides, in our case it was not possible to alter the order of incorporation of two different amines to the thiosquaramides nucleus because the reaction of dithiosquarate 1 with the diamine derived from L-Valine leading to the monosubstitution compound 4 did not work (Scheme 1).

Scheme 1. Synthesis of thiosquaramides.

We initiated a study to calibrate the activity of the novel thiosquaramides against their thioureas (Th-la,b) and squaramides (sq-la,b) homologs taken as reaction model the conjugate addition of 3 -phenyl-susbtituted oxindoles (5a-d) to trans- -nitrostyrene (6a) (Table 1). First we focused our attention on the identification of the best reaction conditions by using 3-phenyl-1-methyl-substituted oxindole 5a as nucleophile,
and $5 \mathrm{~mol} \%$ of thiosquaramide Th-sq-la as catalysts. The reaction occurred easily at room temperature in THF yielding the addition product 7aa in excellent yield and good stereoselection (entry 1 in Table 1), and similar results were obtained when the reaction was carried out in toluene, although at expenses of increase the reaction time (entry 2). The same reaction in chloroform gave the addition product maintaining the stereoselectivity in much lower yield (entry 3), but the best yield, diastereo- and enantioselection were obtained in DCM (entry 4). Only a slight increase in the enantioselectivity was observed when the temperature was lowered to $-20^{\circ} \mathrm{C}$ (entry 5) or $-78^{\circ} \mathrm{C}$ (entry 6).

${ }^{[a]}$ Values refer to pure isolated compound. ${ }^{[b]}$ Measured by HPLC. [c]
Determined by HPLC on a chiral column, and correspond to the major diastereoisomer. ${ }^{[d]}$ Reaction at $-20^{\circ} \mathrm{C}$. ${ }^{[e]}$ Reaction at $-78{ }^{\circ} \mathrm{C}$. ${ }^{[f]}$ Reaction performed with $1 \mathrm{~mol} \%$ of catalyst Th-sq-IIb.

The effectiveness of all the catalysts was then tested under the best experimental conditions (rt, $5 \mathrm{~mol} \%$ of catalyst, DCM) (entries 7-13 in Table 1). From these data it is possible to conclude that catalysts derived from L-Valine (Th-la, sq-la, and Th-sq-la) are more diastereoselective, but less enantioselective than those derived from L-tert-Leucine (Th-lb, sq-lb, and Th-sqlb) (compare entries 7, 9, 11, and 12 versus $8,10,4$ and 13 , respectively), and that thiosquaramides are, in general more effective catalysts than thioureas or squaramides in this reaction. To study the influence of the substituent on the nitrogen atom we reacted different substituted oxindoles (5b-d) with trans- $\beta$ nitrostyrene in the presence of thiosquaramides as the best catalysts (entries 14-19). Interestingly, unsubstituted oxindole 5d
easily reacted leading to 7da, but with lower stereocontrol than the methyl-substituted substrate $\mathbf{5 a}$ (compare entries 19 and 4). The same fact was observed for the reaction of N -Bocsubstituted derivative $\mathbf{5 c}$, in that case the addition product $\mathbf{7 c a}$ was obtained in moderate yield and very poor stereocontrol (entry 18). On the contrary, the reaction of $N$-benzyl-substituted oxindole $\mathbf{5 b}$ was the most stereoselective reaction, independently of the thiosquaramide used as catalyst (entries 14-16). Interestingly, only a slight increase in the reaction time, and lowering diastereoselectivity was observed when the ratio of catalyst Th-sq-Ilb can be decreased to $1 \mathrm{~mol} \%$ (entry 17).
The influence in the reaction of the electronic nature of the substituent at the oxindole and nitroolefin aromatic rings was studied by using different 3 -aryl-1-benzyl-5-substituted oxindoles 5b-I as nucleophiles, $\beta$-aryl nitroolefins $\mathbf{6 a}$-f as electrophiles and Th-sq-Ilb as the best catalyst at room temperature (Table 2). The electronic character of the nitroolefin has little or no influence on the addition process. Both nitrostyrenes bearing electron withdrawing- (6b, c) or donating groups (6d) behave in a similar way that the parent nitrostyrene (6a), yielding the addition products in excellent yield (81-97\%) and stereoselection (dr 92:8-94:6, er 97:3-99:1) (compare entries 1-3 in Table 2 versus entry 16 in Table 1). The reaction of the naphthyl derivative 6 e was slower, although maintaining the excellent yield and stereoselectivity (entry 4 in Table 2), but the furyl nitroolefin $\mathbf{6 f}$ leaded to the addition product $\mathbf{7 b f}$ in good enantioselection and moderate yield and diastereoselectivity (entry 5).

${ }^{\text {[a] }}$ The reactions were carried out with 0.15 mmol of oxindole, 0.30 mmol of nitroalkene, and $5 \mathrm{~mol} \%$ of catalysts in 0.2 mL of DCM. ${ }^{[b]}$ Values refer to pure compounds after column chromatography. ${ }^{[c]}$ Measured by HPLC on a chiral column. ${ }^{[d]}$ The reaction was carried out at $-40^{\circ} \mathrm{C}$. ${ }^{[e]}$ The reaction was scaled up to 1.5 mmol of nucleophile, and yield, $d r$, and er was determined after recrystallization. ${ }^{[f]}$ The reaction was carried out with $20 \mathrm{~mol} \%$ of catalyst.

The effect of a substituent at the aromatic ring in the oxindole was studied by reacting compounds $5 \mathrm{e}-\mathrm{i}$, with a substituent at C 5 , and the $\mathrm{C}-7$ substituted oxindole $5 \mathbf{j}$, with nitrostyrene $\mathbf{6 a}$ (entries 6-15 in Table 2). Interestingly, the presence of a methyl group (5e) or a halogen (5f-h) at C-5 in the oxindole nucleus does not modify the reactivity of the nucleophile, although decreased the diastereoselection maintaining the excellent enantioselectivity (entries 6, 7, 9, and 11 in Table 2). To demonstrate the interest of the process, the reaction of $5 \mathbf{h}$ with 6a was tenfold scaled up with similar results, but increasing the stereoselection to 97:3 dr and 97:3 er, after recrystallization of 7ha (entry 12 in Table 2). On the other hand, the stereoselection was recovered to excellent levels when the reaction was carried out at low temperature $\left(-40^{\circ} \mathrm{C}\right)$ for longer reaction times (entries 8,10 ). The only exception to that general behavior corresponds to 5 -methoxy oxindole $\mathbf{5 i}$, which gave the addition product $\mathbf{7 i a}$ in lower yield although very good diastereo- and enantioselection (entry 13).

Oxindole $5 \mathbf{j}$, with an electron withdrawing substituent at $\mathrm{C}-7$ also reacted easily with nitrostyrene, but yielding 7ja in very poor diastereoselection. Fortunately, both the diastereo- and enantioselectivity were improved at low temperature (compare entries 14 and 15 in Table 2). On the contrary, the electronic nature of a substituent at $\mathrm{C}-4$ in the aryl group attached to $\mathrm{C}-3$ in the oxindole plays an important role in the reaction. Thus, compound $\mathbf{5 k}$ with a 4 '-trifluromethyl phenyl substituent at $\mathrm{C}-3$ easily reacted with nitrostyrene yielding 7ka in good diastereoselectivity and excellent yield and enantioselection but $\mathbf{5 l}$, with an electron-donating ( MeO ) group at the same position gave the addition product 7la with total stereoselectivity in moderate yield (entries 16, 17 in Table 2).

The absolute stereochemistry of the major enantiomer was determined as $(R, R)$ by XR -diffraction analysis for $\mathbf{7 h a}{ }^{[27]}$ (Figure 2 ), and extended for all the addition products by analogy.

Figure 2. ORTEP representation of the structure of 7ha determined by X-ray diffraction analysis. The thermal ellipsoids are shown at $50 \%$ probability.

Furthermore, in an attempt to increase the scope of the process we study the reaction of the less acidic 3 -methyl substituted oxindole 5 m with nitrostyrene. As expected, the reaction was really slow ( 120 h ) when $5 \mathrm{~mol} \%$ of catalyst was used, but it was completed in 24 h with good yield, moderate diastereoselection (dr 79:21), and excellent enantioselection (er 95:5) by increasing the ratio of catalyst Th-sq-Ilb to $20 \mathrm{~mol} \%$ (entry 18 in Table 2). As an example of the synthetic utility of the reaction we have prepared, in two steps, the enantioenriched spirooxindolyl lactam 8, with two contiguous quaternary-tertiary stereocenters as summarized in Scheme 2. These class of compounds have recently received a great synthetic interest ${ }^{[28]}$ because their important biological properties. ${ }^{[29]}$

A solution of $5 \mathbf{n}$ and trans- $\beta$-nitrostyrene ( $\mathbf{6 a}$ ) in DCM was stirred at r.t. for 24 h in the presence of $20 \mathrm{~mol} \%$ of $\mathbf{~ T h}$-sq-llb leading to the addition product 7 na in good yield ( $82 \%$ ), moderate diastereoselectivity ( $d r$ 79:21), and excellent enantioselection (ee 94:6). The major diastereoisomer was isolated by flash chromatography, and transformed into spirooxindolyl lactam 8 ( $83 \%$ ) by reduction of the nitro group with $\mathrm{Zn} / \mathrm{HOAc},{ }^{[30]}$ and in situ lactamization. HPLC on a chiral phase shown that compound 8 was obtained with the same enantiomeric ratio than 7na, showing that no epimerization occurred during the reduction-lactamization process.

## Conclusions

We have prepared four novel thiosquaramides in two steps by sequential transamination of cyclopentyl dithiosquarate with benzylamine or 3,5-bis(trifluoromethyl)benzylamine, and chiral diamines derived from L-Valine or L-tert-Leucine. These thiosquaramides have been tested as organocatalysts in the stereoselective addition of 3 -substituted oxindoles to different trans- $\beta$-aryl nitroolefins. The reported data show that the nitroMichael addition occurred in high yield and diastereoselectivity, and excellent enantioselection. The novel organocatalysts provide much better results than their thiourea or squaramide counterparts. The described strategy has been applied as a key step in the synthesis of an example of enantioenriched biologically active spirooxindolyl lactam.

## Experimental Section

## General

New compounds were characterized by ${ }^{1} \mathrm{H}$ NMR ( 500 MHz ), ${ }^{13} \mathrm{C}$ NMR ( 126 MHz ), high-resolution mass spectrometry (Agilent 5973, ESI-QTOF), IR spectroscopy (Perkin-Elmer Spectrum One FT-IR spectrometer), and elemental analysis (Elemental Analysis Center of the Complutense University of Madrid, using a Perkin Elmer 2400 CHN). Chemical shifts for protons and carbons are reported in ppm from TMS with the residual $\mathrm{CHCl}_{3}$ resonance for protons, and carbon resonance of the solvent for carbons as internal references. Data are reported as follows: chemical shift, multiplicity ( $s=$ singlet, $d=$ doublet, $t=$ triplet, $q=$ quartet, $m=$ multiplet, $\mathrm{br}=$ broad), coupling constants in Hertz, and integration.
Specific rotations (concentration given in g per 100 mL ) were measured on a Perkin-Elmer 341 digital polarimeter using a $5-\mathrm{mL}$ cell with a 1 -dm path length, and sodium lamp. Melting points were obtained with open capillary tubes and are uncorrected. TLC analysis was performed on glass-backed plates coated with silica gel 60 and an F254 indicator, and visualized by either UV irradiation or by staining with phosphomolybdic acid solution, and Column chromatography was carried out using silica gel (230-240 mesh).
Chiral HPLC analysis was performed on a JASCO HPLC system (JASCO PU-2089 pump and UV-2075 UV/Vis detector) and on HewlettPackard 1090 Series II instrument equipped with a quaternary pump, using a Chiralpak IA, Lux-amylose-1 and Lux-i-Amylose-1 analytical columns ( $250 \times 4.6 \mathrm{~mm}$ ). UV detection was monitored at 220 or at 254 nm .
Commercially available organic and inorganic compounds were used without further purification. Solvents were dried and stored over microwave-activated $4 \AA$ Å molecular sieves. Known compounds $\mathbf{1}^{[8 \mathrm{ab}]}, \mathbf{2},{ }^{[8 \mathrm{a}]}$ $\mathbf{5 a - b}, \mathbf{d}, \mathbf{I},{ }^{[31]} \mathbf{5 c},{ }^{[32]} \mathbf{5 e},{ }^{[33]} \mathbf{5 m},{ }^{[34]}$ and $5 n^{[35]}$ have been prepared as described in the literature.
3-((3,5-Bis(trifluoromethyl)benzyl)amino)-4-(cyclopentoxy)cyclobut-3-ene-1,2-dithione (3). To a solution of 1 ( $1.20 \mathrm{~g}, 4.25 \mathrm{mmol}, 1.0$ equiv) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was added $3,5-$ bis(trifluoromethyl)benzylamine ( $0.42 \mathrm{~mL}, 3.83 \mathrm{mmol}, 0.90$ equiv) at $0{ }^{\circ} \mathrm{C}$ and the resulting solution was stirred for 15 min at that temperature, and then 15 min at room temperature. The solution was transferred to a silica gel column and quickly eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to afford $3(1.18 \mathrm{~g}, 2.68 \mathrm{mmol}, 70 \%$ ) as an
amorphous yellow solid; \%), m.p. $84-85{ }^{\circ} \mathrm{C}$. The compound exists as a mixture of two rotamers in DMSO at room temperature in a ratio 0.61:0.37. Major rotamer: ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}$ ) $\delta=10.14(\mathrm{t}, \mathrm{J}=$ $6.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.10(\mathrm{~s}, 1 \mathrm{H}), 8.04(\mathrm{~s}, 2 \mathrm{H}), 6.34(\mathrm{~m}, 1 \mathrm{H}), 4.76(\mathrm{~d}, J=6.0 \mathrm{~Hz}$, 2H), 2.00-1.84 (m, 4H), 1.77-1.57 (m, 4H) ppm. Minor rotamer: ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d} 6$ ) $\delta 10.07$ (t, $J=6.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 8.10 (s, 1H), 8.04 (s, $2 \mathrm{H}), 6.29(\mathrm{~m}, 1 \mathrm{H}), 5.37(\mathrm{~d}, \mathrm{~J}=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 2.00-1.84(\mathrm{~m}, 4 \mathrm{H}), 1.77-1.57$ (m, 4H) ppm. ${ }^{13} \mathrm{C}$ NMR (126 MHz, DMSO-d 6 ) $\delta=217.9,217.7,206.8$, $206.8,183.5,182.8,176.1,173.8,141.1,141.0,130.9$ (q, ${ }^{2}{ }^{\text {JC-F }}=32.9$ $\mathrm{Hz}), 130.9\left(\mathrm{q},{ }^{2} \mathrm{~J}_{\mathrm{C}-\mathrm{F}}=32.9 \mathrm{~Hz}\right), 129.5(\mathrm{~m}), 129.2(\mathrm{~m}), 123.7\left(\mathrm{q},{ }^{1} \mathrm{~J}_{\mathrm{C}-\mathrm{F}}=\right.$ $272.8 \mathrm{~Hz}), 122.0(\mathrm{~m}), 87.9,87.8,47.5,45.5,35.4,34.2,34.1 ., 23.7,23.5$, 23.4 ppm . General procedure for the synthesis of oxindoles $5 \mathrm{f}-\mathrm{k}$. The synthesis of these compounds was carried out in two steps as previously described. ${ }^{[31]}$ To a cooled solution ( $0{ }^{\circ} \mathrm{C}$ ) of the corresponding benzylisatin ( 17.0 mmol ) in THF ( 55 mL ) was added a solution of the corresponding arylmagnesium bromide in $\mathrm{Et}_{2} \mathrm{O}$ ( $20.4 \mathrm{mmol}, 1.2$ equiv) under nitrogen atmosphere. The mixture was warmed to room temperature and stirred for 30 min . The reaction was quenched with $\mathrm{MeOH}(20 \mathrm{~mL})$ and aqueous solution of $\mathrm{NH}_{4} \mathrm{Cl}(20 \mathrm{~mL})$, and extracted with EtOAc ( $3 \times 20 \mathrm{~mL}$ ). The organic layer was washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure to give an orange oil. The compounds were purified by flash column chromatography on silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} /\right.$ pentane $1: 1$ to $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 9: 1$ ) affording the corresponding 3-hydroxy-3-arylindolin-2ones.
A mixture of the corresponding 3-hydroxy-3-arylindolin-2-one (17.0 mmol ) in 95 mL of HOAc , and $\mathrm{SnCl}_{2}$ ( $34.0 \mathrm{mmol}, 2$ equiv) was stirred at $110^{\circ} \mathrm{C}$ for 2 h and then cooled to room temperature. After elimination of the HOAc under vacuum, the residue was diluted with EtOAc. The solution was successively washed with water, an aqueous solution of $\mathrm{NaHCO}_{3}$, brine, and dried over $\mathrm{MgSO}_{4}$. The mixture was purified by flash chromatography on silica gel (Hexane/EtOAc $8: 1$ to $4: 1$ ) to give the final compounds as white solids.

1-Benzyl-5-fluoro-3-phenylindolin-2-one (5f). Compound $5 f$ was obtained according to the general procedure using 1-benzyl-5-fluoroindoline-2,3-dione ${ }^{[36]}$ ( $4.34 \mathrm{~g}, 17.0 \mathrm{mmol}$ ). General procedure for the enantioselective Michael addition. A mixture of oxindole $5 \mathrm{a}-\mathrm{n}$ ( 0.15 mmol ), catalyst ( $0.0075 \mathrm{mmol}, 0.05$ equiv) and nitroolefins 6a-f ( $0.3 \mathrm{mmol}, 2$ equiv) in 0.2 mL of DCM was stirred at r.t. in Wheaton vial until consumption of the starting material (monitored by ${ }^{1} \mathrm{H}$-NMR). After solvent removal under reduced pressure, the crude mixture was purified by flash column chromatography to afford the corresponding product. The enantiomeric excess was determined by chiral-phase HPLC analysis using mixtures of hexane/isopropanol as eluent.
( $R$ )-1-Methyl-3-(( $R$ )-2-nitro-1-phenylethyl)-3-phenylindolin-2-one
(7aa). Product 7aa was obtained according to the general procedure, using oxindole 5a, nitrostyrene $\mathbf{6 a}$ and catalyst $\mathbf{T h}$-sq-la at $-78^{\circ} \mathrm{C}$. The crude reaction mixture was purified by flash chromatography (Hexane/EtOAc: 8:1 to 4:1) leading to compound 7aa as an inseparable mixture of diastereoisomers. ## FULL PAPER

Four novel chiral bifunctional thiosquaramides have been prepared from cyclopentyl dithiosquarates and diamines derived from natural L-Valine and L-tert-Leucine. The novel thiosquaramides have been tested as organocatalyst in the nitro-Michael addition of 3 -substituted oxindoles to different $\beta$-aryl substituted nitroalkenes. The reaction occurred easily in high yields and excellent stereoselectivities.

## Asymmetric Organocatalysis
